Classification	Internal Knowledge Base
Document Id	NC-GDE-ACC-001
Document Type	Operational Guide

1. Account Identification

Agents must verify the customer using approved account identifiers before discussing account-specific information. Customer identity and account status should be retrieved from authoritative systems.

2. Authentication Service

The Authentication Service manages login credentials, session validation, and account access. Login failures may result from incorrect credentials, expired sessions, account lockout, or an Authentication Service incident.

3. Login Failure Workflow

First determine whether the problem is isolated to one customer or affects multiple customers. For isolated cases, guide the customer through account recovery. For repeated failures across customers, check the incident dashboard and Authentication Service status.

• Verify account identity.

• Check account lock or recovery state.

• Confirm Authentication Service availability.

• Reset or recover access using approved procedures.

• Escalate repeated service-wide failures.

4. Account Changes

Changes to email, profile information, or security settings require account verification. Sensitive changes must follow security controls and must not be completed solely from unverified customer requests.

5. Relationship to Support Intelligence

Account issues should retain links between customer, account, ticket, product, and relevant incident. These relationships may later be represented in the SupportMind knowledge graph.
