Document Type	Policy

1. Payment Architecture

NovaCare uses a Payment Gateway for transaction authorization and settlement, a Subscription Service for entitlement state, and a Notification Service for customer payment notifications. These systems exchange transaction and status events.

2. Payment States

Supported operational states include initiated, authorized, captured, failed, pending, reversed, and refunded. Support agents must rely on the verified transaction state rather than the presence or absence of a customer notification.

3. Timeout Handling

A gateway timeout means NovaCare did not receive a timely response. It does not establish whether the external processor completed the transaction. The correct action is reconciliation. Retrying immediately can create duplicate-payment risk.

• Record the original transaction ID and timestamp.

• Check gateway reconciliation status.

• Check whether a capture or settlement event exists.

• Do not issue a second charge while the first transaction is unresolved.

• Escalate repeated timeout patterns as an operational incident.

4. Duplicate Payments

If two completed transactions exist for the same customer, product, amount, and billing period, the case must be reviewed as a possible duplicate payment. Refund handling follows the Refund Policy.

5. Monitoring

Operations should monitor payment failure rate, gateway timeout rate, duplicate-payment reports, and payment-to-subscription state mismatches. A sudden increase in timeout events may indicate a broader incident.

6. Security

Payment credentials must not be stored in support notes. Agents should use transaction references and approved account verification procedures.
